

# Using population decoding to understand neural content and coding

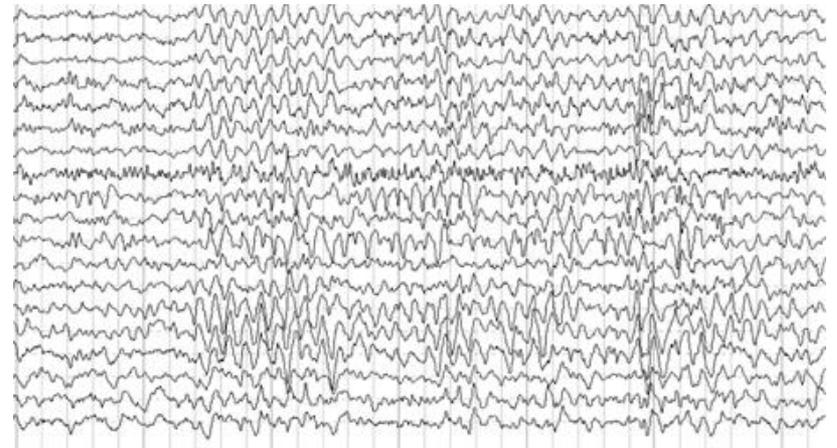

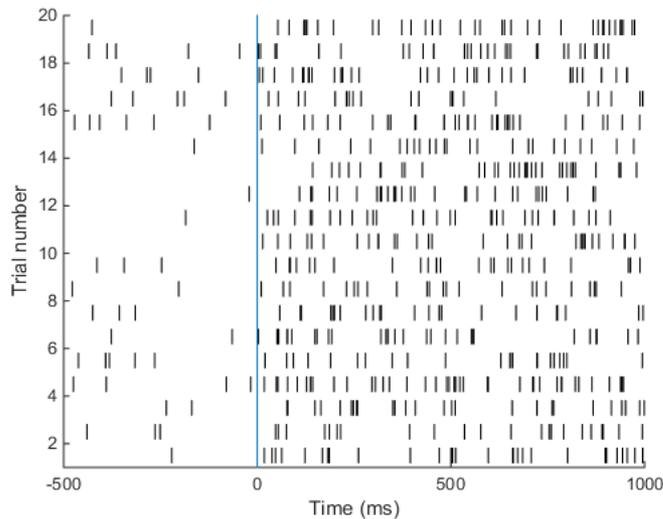

The Center for Brains,  
Minds & Machines

# Motivation

We have some great theory about how the brain works

We run an experiment and make neural recordings

We get a bunch of data...

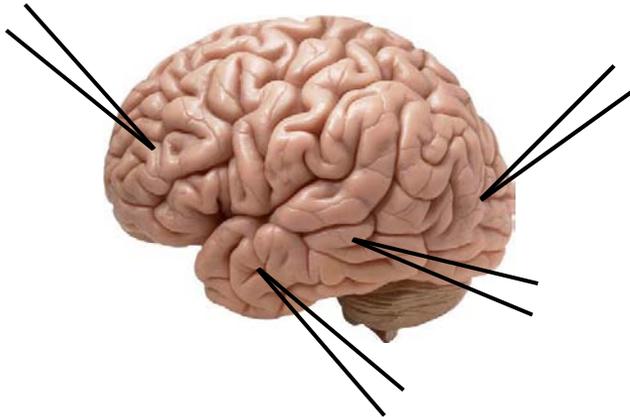

How can we convert data into answers?

# What do I want from a data analysis method?

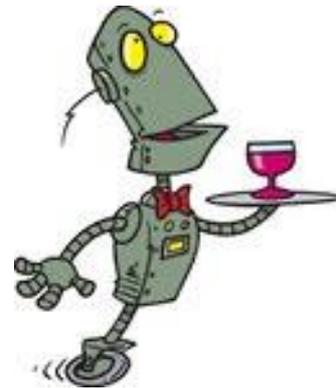

Clear answers to:

Neural content: What information is in a brain region?

Neural coding: What features of the activity contain information?

# Talk Outline

What is population decoding?

Using decoding to understand **neural content**

Using decoding to understand **neural coding**

How to analyze your own data

# Neural population decoding

**Decoding:** Predict stimulus/behavior from neural activity

$f(\text{neural activity}) \longrightarrow \text{stimulus}$

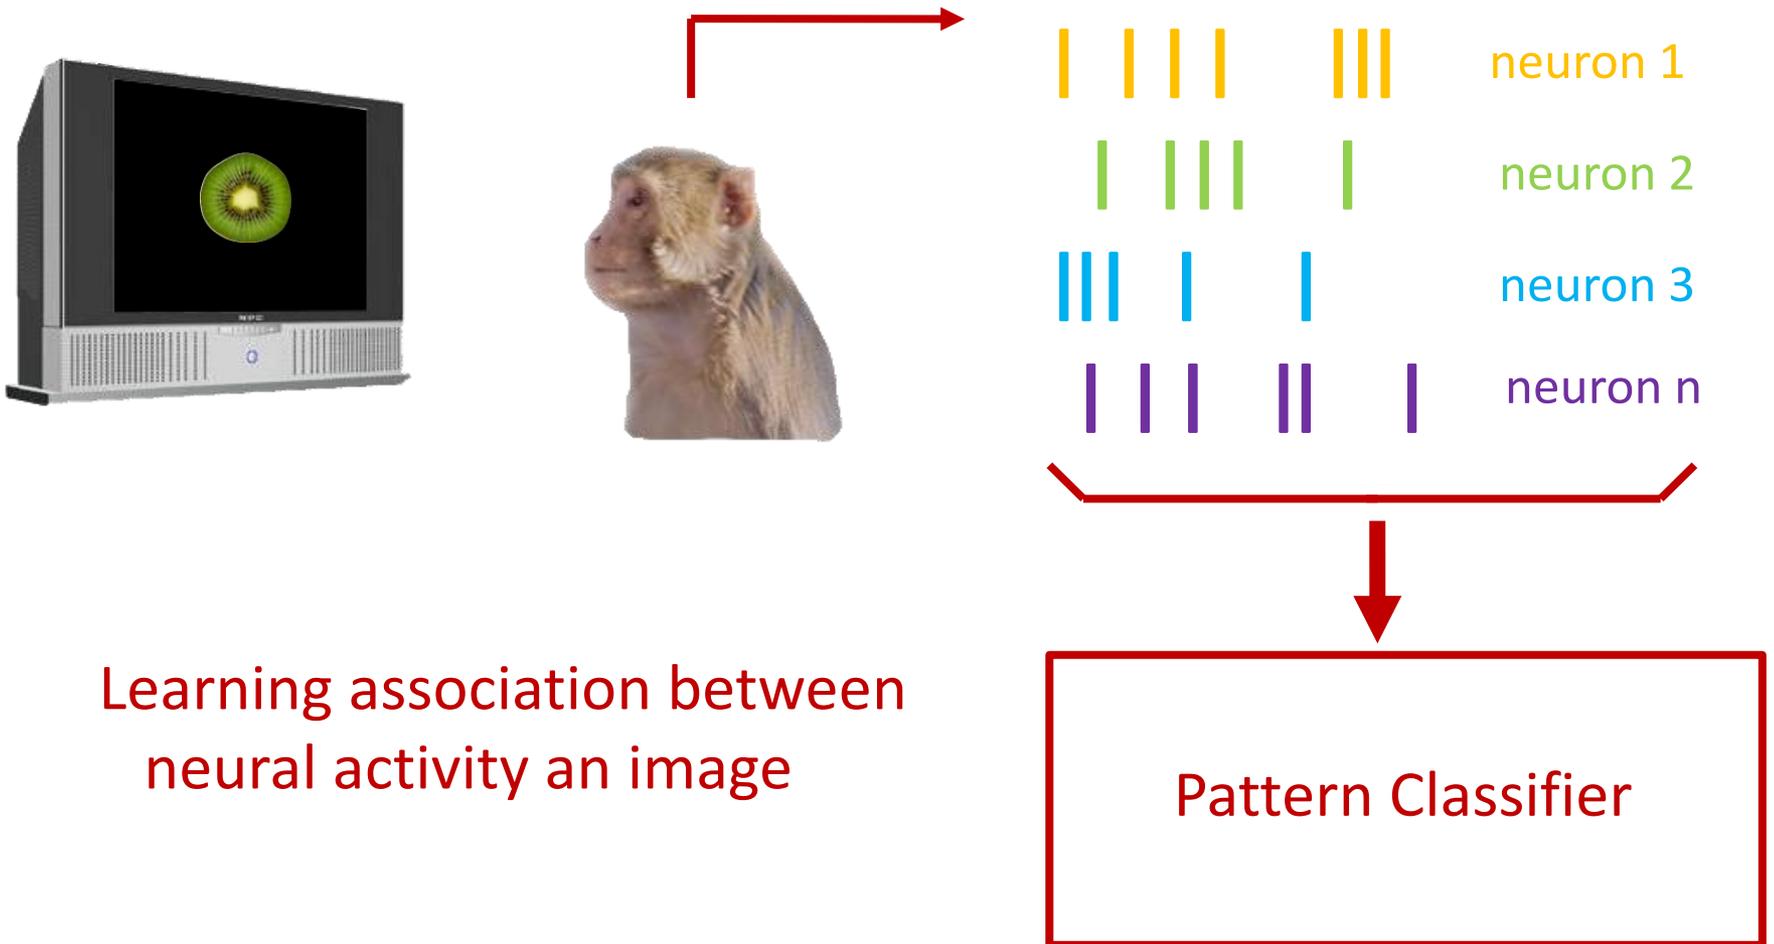

Decoding approaches have been used for 30 years

- Motor system: e.g., Georgopoulos et al, 1986
- Hippocampus: e.g., Wilson and McNaughton, 1993
- Computational work: e.g., Salinas and Abbott, 1994

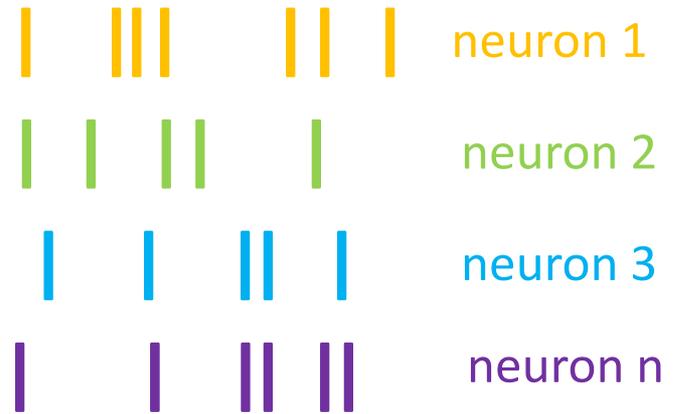

Alternative names for decoding:

- Multivariate Pattern Analysis (MVPA)
- Readout

# Summary of neural content

Decoding offers a way to clearly see information flow over time

For assessing basic information, decoding often yields similar results as other methods

Decoding allows one to assess whether information is contained in an abstract/invariant format, which is not possible with other methods

Is information coded in high firing rates or patterns?

## Decision Rule

### Poisson Naïve Bayes Classifier

Total activity and pattern

$$\arg \max_c \log(\mathbf{w}_c)^T \mathbf{x} - n\bar{w}_c$$

### Minimum Angle Classifier

Pattern only

$$\arg \max_c \frac{\mathbf{w}_c^T \mathbf{x}}{\|\mathbf{w}_c\| \|\mathbf{x}\|}$$

### Total Population Activity Classifier

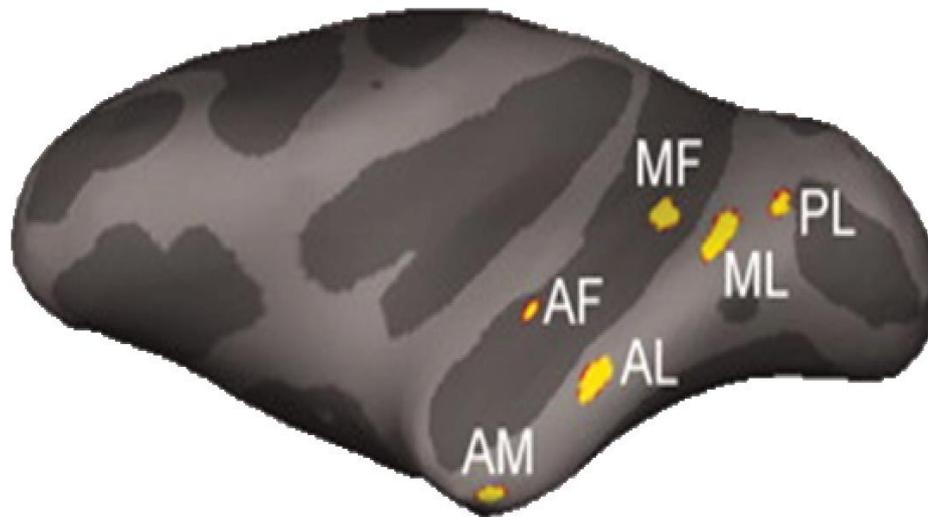

Total activity only

$$\arg \max_c |\bar{w}_c - \bar{x}|$$

$\mathbf{w}_c$  are the classification weights for class  $c$   
 $\mathbf{x}$  is the test point to be classifier

# Is information coded in high firing rates or patterns?

## *Pose specific face identification*

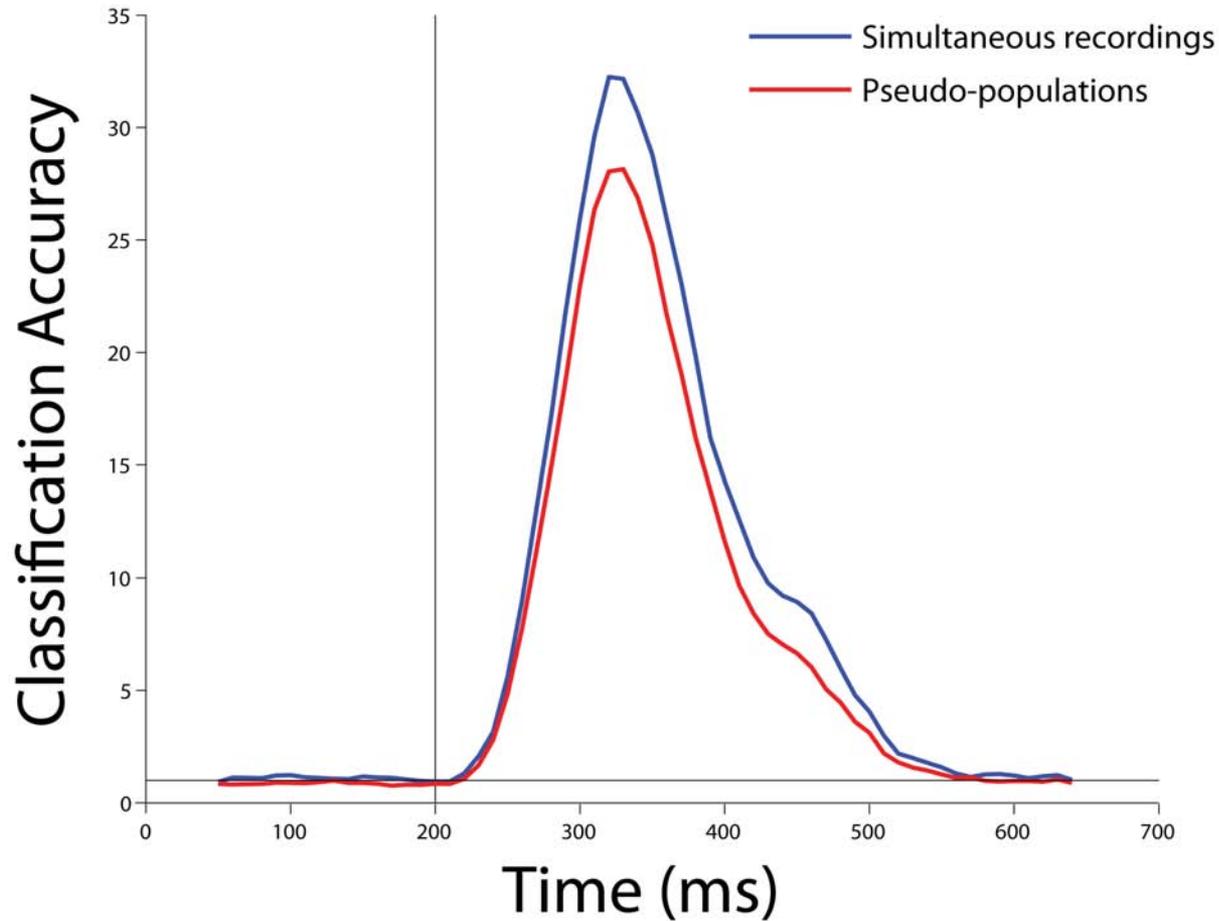

Poisson Naïve Bayes – Total activity and pattern

Minimum Angle – Pattern only

Total Population Activity - Total activity only

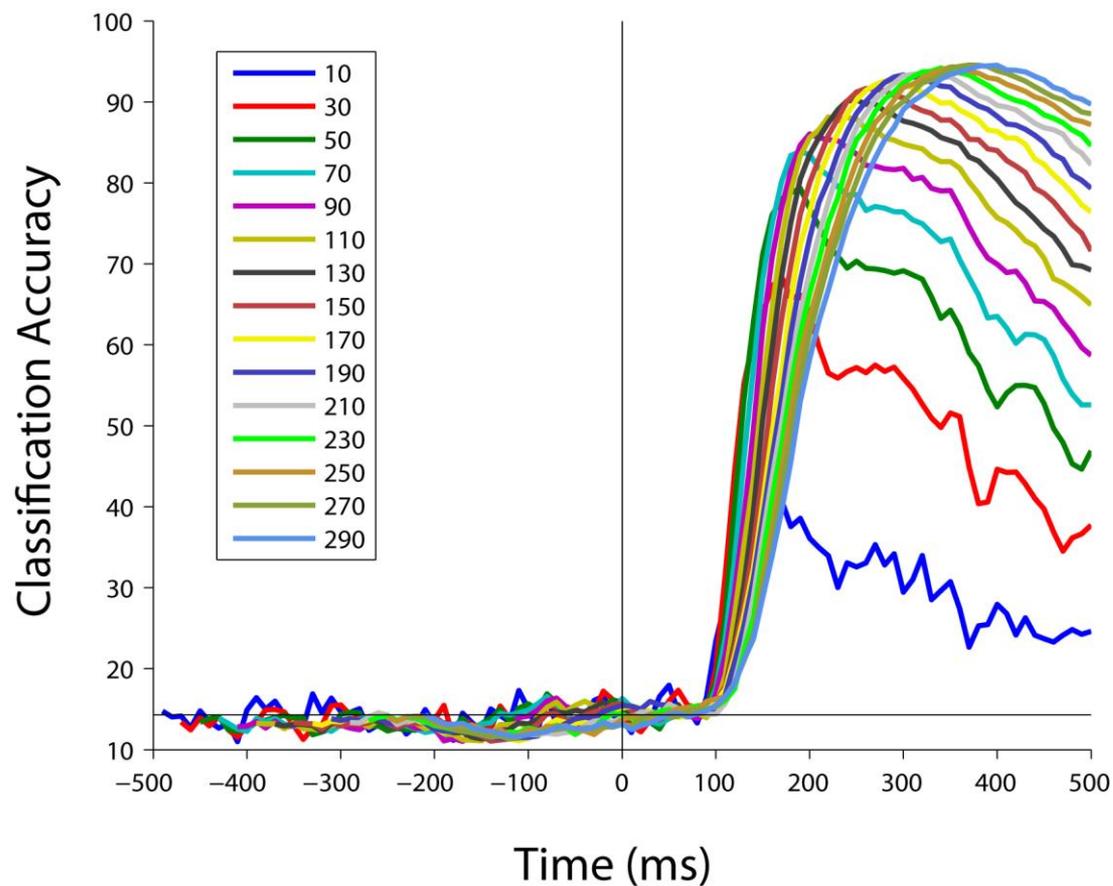

Meyers, Borzello, Freiwald, Tsao, 2015

# Independent neuron code?

Data courtesy of the DiCarlo lab; see Ami Patel's MEng thesis

# Precision of the neural code (temporal coding)

(basic results – clearly room to explore this further)

See Meyers et al, COSYNE, 2009

# Summary of neural coding

Decoding allows you examine many questions in neural coding including:

- Compact/sparse coding
- Dynamic population coding
- Independent neural code
- Temporal precision/temporal coding

# Decoding can be applied to other types of data

## MEG/EEG (LFPs, ECoG)

## Continuous decoding

- [nSTAT](#)

# Limitations of decoding

Hypothesis based – could be overlooking information that is not explicitly tested for

Just because information is present, doesn't mean it's used

Decoding focuses on the computational and algorithmic/representational levels, does not give a mechanistic explanation of the phenomena

Decoding methods can be computationally intensive, analyses can be slow to run

# The Neural Decoding Toolbox (NDT)

Makes it easy to do decoding in MATLAB:

```
1  binned_file = 'Binned_data.mat';
2  ds = basic_DS(binned_file, 'stimulus_ID', 20);
3  cl = max_correlation_coefficient_CL;
4  fps{1} = zscore_normalize_FP;
5  cv = standard_resample_CV(ds, cl, fps)
6  DECODING_RESULTS = cv.run_cv_decoding;
```

Open Science philosophy: open source for reproducible results

- The code open source for reproducible results
- Hope to encourage open science culture, so please share your data

Meyers, Front Neuroinfo, 2013

# The Neural Decoding Toolbox Design

## Toolbox design: 4 abstract classes

**1. Datasource:** creates training and test splits

- E.g., can examine the effects from different binning schemes

**2. Preprocessors:** learn parameters from training data apply them to the training and test data

- E.g., can examine sparse/compact coding

**3. Classifiers:** learn from training data and make predictions on test data

- E.g., can examine whether information is in high firing rates or patterns

**4. Cross-validators:** run the training/test cross-validation cycle

# Getting started with your own data

You can use the NDT on your own data by putting your data into 'raster format'

Figure removed due to copyright restrictions. Please see the video or Figure 3 from Meyers, Ethan M. "The neural decoding toolbox." *Frontiers in neuroinformatics* 7 (2013).
